                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 11, Application US/09081975

Patent No. 6451979

GENERAL INFORMATION:

APPLICANT: Kaelin, William
APPLICANT: Jost, Christine
TITLE OF INVENTION: METHODS OF TREATMENT USING
TITLE OF INVENTION: ANTIBODIES AND PROTEINS THERETO, AND USES OF THE
TITLE OF INVENTION: ANTIBODIES
NUMBER OF SEQUENCES: 27
CORRESPONDENCES: 27
CORRESPONDENCES: 27
CORRESPONDENCES: 27

Sequence 16, Application US/09081975

Patent No. 6451979

GENERAL INFORMATION:
APPLICANT: Acelin, William
APPLICANT: JOSE, Christine
TITLE OF INVENTION: METHODS OF TREATMENT USING
TITLE OF INVENTION: NBS-1, ANTIBODIES AND PROTEINS THERETO, AND USES OF THE
TITLE OF INVENTION: ANTIBODIES
TUTLE OF INVENTION: ANTIBODIES
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 14, Application US/09081975

Patent No. 6451979
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Kaelin, William
APPLICANT: Jost, Christine
TITLE OF INVENTION: METHODS OF TREATMENT USING
TITLE OF INVENTION: NBS-1, ANTIBODIES AND PROTEINS THERETO, AND USES OF THE
TITLE OF INVENTION: ANTIBODIES
NUMBER OF SEQUENCES: 27
CORRESPONDENCES 27
CORRESPONDENCE ADDRESS:
ADDRESSEE: ALXON Peabody LLP
STREET: 101 Federal Street
                                                                                                                                                                                                                                                                                                                                                                                                         ö

Patent No. 5702908

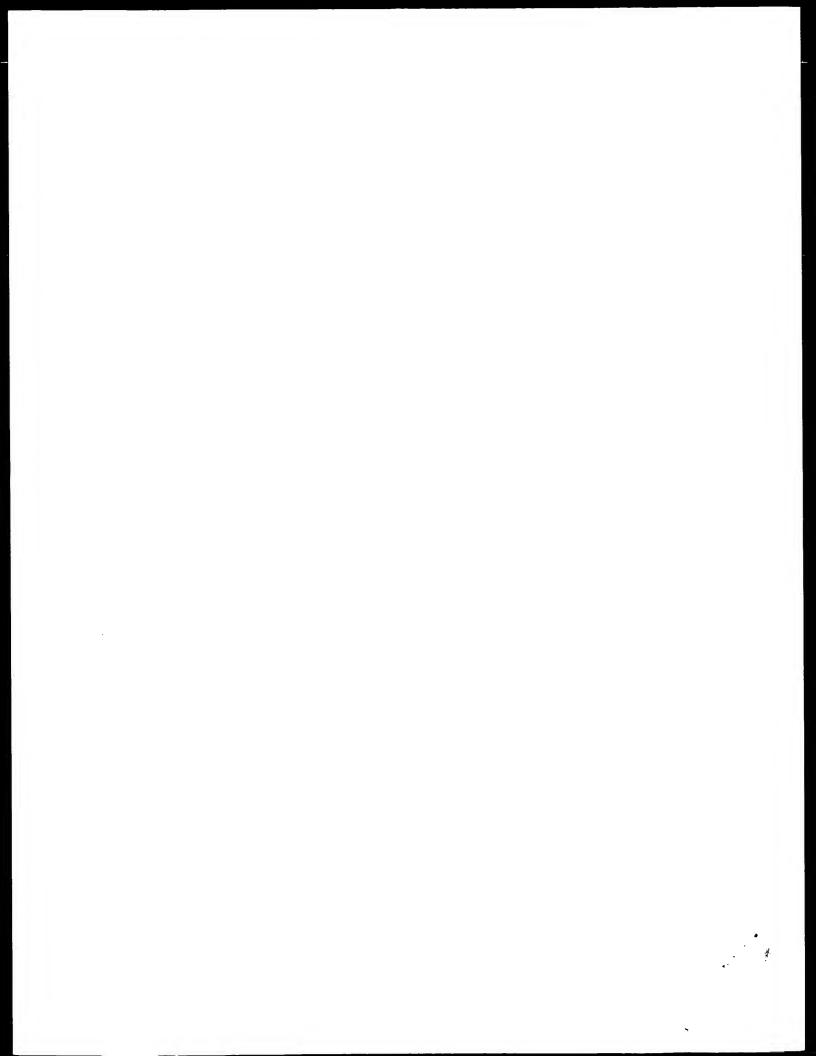

APELICANT: Pickeley, Steven M.
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:
ADDRESSEE: Flehr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400
                                                                      APPLICANT: Picksley, Steven M.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2,

Patent No. US/00201329771

GENERAL INCRATION:

APPLICANT: Yuan, Zhi-Min

APPLICANT: Yuan, Zhi-Min

TITLE OF INVENTION: Inhibition of p53 Degradation

FILE REFERENCE: 21508-044

CURRENT APPLICATION UNMER: US/09/732,384

CURRENT APPLICATION NUMBER: 60/169,816

PRIOR APPLICATION NUMBER: 60/169,816

PRIOR FILING DATE: 199912-08

NUMBER OF SEQ ID NOS: 10

SOFTWARE: PatentIn Ver. 2.1

Databası

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is a peptide homologue of a region of p53 which binds to mana. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells on or overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.
This sequence is a peptide homologue of a region of p53 which binds to madm2. This peptide is used in the construction of a movel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells on or overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 tunction. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              p53; mdm2; inhibitor; therapy; activator; treatment; cancer; medicament.

```
This represents a p53 N-terminal peptide fragment used in an Elisa TIP assay for analysing the interaction between human oncogenic protein MDM2 can dip53. The invention provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated can peptides may be used to identify molecules that bind compared to identify and design inhibitors of MDM2, p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia conteractions, especially tumours and viral infections. The peptides can interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and caccumulation in normal cells. The peptides which mimic the MDM2 binding content in p53, have a significantly greater blocking activity compared content with wild-type p53.
                                                                                                                                                                                                                                                                                                           MDM2; oncogenic protein; p53; human; inhibition; interaction; cancer; tumour; diagnosis; binding; viral infection; Elisa TIP assay.

p53/RB interaction inhibiting peptide 6 (residues 11-29 of human p53).
                                                                                                                                                                                                                                                                                                                                                               Antibodies specific for p53 are detected by binding to immobilised fragments of the p53 gene product containing the antibody-binding region. Preferred fragments contain maino acids 1-241, 06-349, 40-393, 66-241, 66-393, 237-349, 237-393 and esp. 9-33, 37-52 or 368-386. See AAR51872-R51881 for sequences of these fragments.

corresponds to residues 11-29 of human p53 (AAW47079). The interaction between p53 aprotein and a retinoblastoma (RB) protein. This peptide corresponds to residues 11-29 of human p53 (AAW47079). The interaction between p53 and Rb is found to be critical for determining whether or not a cell enters apoptosis. Apoptosis is prevented if interaction occurs. The interaction is between regions 1-71 or 290-393 of p53 and region 739-928 of Rb. The invention provides methods to identify compounds able to modulate interaction or binding between them These inhibitory and detecting interaction/binding between them These inhibitory compounds are used in human or veterinary medicine to modulate p53 activity and processes, specifically for inducing apoptosis in tumour cells (possibly also in cells infected by virus), in vivo or in vitro. Expression of these modulators by gene therapy methods is also contemplated. Other activities that can be affected are transcription repression, G1 arrest, DNA repair, homologous recombination and 23-5- exonuclease activity. Modulation of interaction with Rb may also
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
               This peptide fragment of p53 is an inhibitor of the interaction between

This p53 biotinylated N-terminal peptide fragment is used in an Elisa P2 assay for analysing the interaction between human oncogenic protein MDM2 and p53. The invention provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2 and to identify and design inhibitors of MDM2, p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia interactions, especially tumours and viral infections. The peptides can be administered masally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and site in p53, have a significantly greater blocking activity compared with wild-type p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

```
p53 tumour suppressor protein and the MDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which and acid changes altered binding to expressed MDM2. The peptides and methods of identifying aniliar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptides of the invention which interfere with the binding of the

Assays and screening methods based on direct interaction between FHA domains and phosphopeptides, useful for characterizing binding and to identify binding partners and modulators of FHA domain-phosphopeptide - buipuiq

Disclosure; Fig 2; 92pp; English.

The present invention describes isolated prepared P53 epitopes (I). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids, (3) a vaccine composition comprising (II), a unit dose of a peptide with less sequence of p53, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) as cytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II) are useful as diagnostic agents and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be The present invention relates to assays and screening methods based on a direct interaction between fork head associated (FHA) domains and phosphorylated polypeptides, for characterizing the binding of these molecules. FHA peptides may be useful for treating medical conditions associated with defects in transcriptional control, DNA replication, DNA repair, cell cycle control or other cellular process. The method may provide valuable insights into checkpoint signalling, has important implications for the functions of other FHA domain-containing proteins and provides basis for new lines of therapy. The present sequence is a peptide used in the present invention. Gaps Epitope-based vaccines comprising P53 epitope having a specified sequences, useful for treating and preventing cancer, the epitopic peptides is useful as diagnostic agents and for evaluating immune Human; p53; tumour suppressor; human leukocyte antigen; HLA; CTL; cytotoxic T lymphocyte; T cell; immune response; tumour; cancer; vaccine; epitope; cytostatic. The polypeptide is used to detect anti-p53 autoantibodies in a human patient. The antibody can be used to determine the post-translational modification state of a p53 protein. These are used especially in the diagnosis of cancer. The present sequence
          immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigens, which might have their own intrinsic biological activity, are eliminated. AAG89363 to AAG89747 represent amino acid sequences used in the exemplification of the

Patent No. 5702908
GENERAL INFORMATION
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof
NUMBER OF SEQUENCES: 27
CORRESPONDENCE ADDRESS:
ADDRESSEE Flehr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400
